CSS Units

CSS Units are used for defining length in webpages

% — Relative to the parent element's value for that property

Relative to the current font-size of the element — **em**

rem — Relative to the font-size of the root ie => html ("rem" = "root em")

Relative to the Number of characters eg=> 5ch gives width of 5 characters — **ch**

→

vh

Relative to the height of the viewport. 1vh = 1/100 of the viewport's height

Relative to the width of viewport. 1vw = 1/100 of the viewport's width.
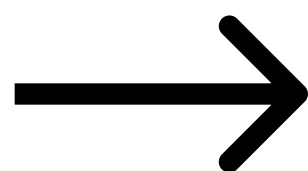

vw

vmin

Smaller Viewport width out of vw and vh
eg: will return vh for desktop and vw for mobile

Bigger Viewport width out of vw and vh
eg: will return vw for desktop and vh for mobile

vmax

ex↕

Relative to height of the current font's lowercase "x".
